

Benefits

- Identify, solve and prevent duplicate registrations
- Improve your data quality
- Gain better insight into your business
- Prevent image loss
- Reduce costs

Improve your data quality

Today's digitalization leads to increased complexity in information systems and dependent processes. Everything is registered in large databases.

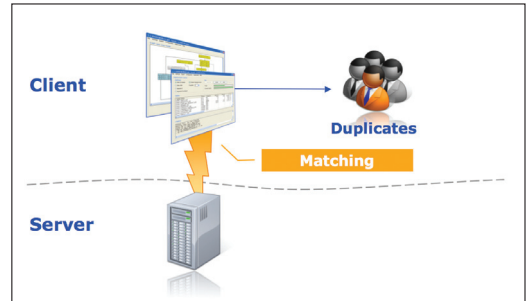

The consequences of poor data quality due to duplicate registrations of customers, products and addresses, is often underestimated and can give a distorted representation of reality. Many processes in organizations are heavily dependent on the quality of this data. However, a lot organizations struggle with these problems and don't have the right resources or tools. This can lead to inefficiency, high costs, image loss and customer dissatisfaction.

DATPROF Match offers organizations a solution to identify, solve and prevent duplicate registrations, even in high volumes of data.

Features

- Fuzzy matching
- High volume
- Context-insensitive
- Export and reporting
- Command line & batch integration
- High performance
- Integration with other DATPROF software
- Multithreading

Identify, solve and prevent duplicates

Functionality

Many business processes are heavily dependent on the data quality in information systems. The continuous digitalization increases the importance of improving the data quality. DATPROF Match offers powerful fuzzy matching algorithms for identifying duplicate registrations in databases. The software uses context-insensitive algorithms, which means that every type of data can be validated. Different cleaning strategies can be applied for increasing the reliability of the matching results. The software has an easy to use interface which supports various database platforms.

Integration

Besides the user version of DATPROF Match, the kernel can also be integrated in other processes and scheduled in batches. This enables you to apply the powerful fuzzy matching technology to existing environments. Not only for identifying duplicates, but also for preventing duplicate registrations.

High data volumes

This software has been designed to process high data volumes by using features like multi threading parallel processing and segmentation. The software can be executed on any platform.
